

The AMGEN course that I have attended allowed me to greatly improve my knowledge on IBSE and in particular to gain enough confidence on the various tools and best strategies that could be implemented in my courses.

I've found particularly useful the case studies that, together with my colleagues, could be effectively implemented with my students. During these workshops we could also play the "students" role, which allowed us to think about the key aspects of the IBSE and its didactical role. My three keys learning after this course are: Sharing, Planning and Growing. The AMGEN workshop is being an occasion to share and compare the meaning of scientific teaching; it's being an incentive for the implementation of more effective didactical methods and overall a great opportunity for a personal and professional growth.

As a teacher I think it is very important to continuously fuel the passion for teaching science and fostering curiosity and research spirit in our students.
